Elzbieta Falkowska

The result of thyroid gland USG

The thyroid gland enlarged moderately within the region of the right lobe. Volume of the right lobe, comparing to the previous examination, has decreased significantly and the current volume is about 15 ml, the left lobe volume is 1,5 ml. In the right lobe a visible nodule of a mixed echogenic structure, the size of it 2,5 x 1,5 cm, with the focal lesions and calcifications (smaller than in previous examination). The isthmus with no signs of pathological change. Echogenicity of the left lobe parenchyma homogenous.

THE RESULT OF RADIOLOGY EXAMINATION

The result of thyroid gland USG

The thyroid gland enlarged significantly within the right lobe region. Its volume is about 25 ml, the left lobe small, of volume about 1,5 ml. All right lobe has been taken by a large nodule of mixed echogenicity, with focal lesions and calcifications, the size of a nodule 4,7 x 2,2 cm. The isthmus with no signs of pathological changes. The parenchyma of the left lobe without visible separated nodules. The enlarged, pathological cervical lymph nodes are not visible.

DGN. Nodular goitre.
